> The Piece Hall, Halifax

A combination of PAREX BS 7533-compliant mortars has been used for a major public realm hard landscaping scheme carried out as part of a heritage conservation and transformation programme at The Piece Hall, Halifax, which was built in the 18th century as a trading hub for the Yorkshire woollen industry. The Piece Hall has a square footprint around an extensive courtyard which is surrounded on all sides by many small trading units. Later, the building became the town's market and has served as a cultural and commercial centre since an initial refurbishment in the 1970s.

The Grade 1 listed Piece Hall has more recently undergone a multi-million pound conservation and transformation programme designed to create a world-class cultural, commercial, educational and visitor destination. The Piece Hall transformation project was delivered by Calderdale Council. The construction work was carried out by Graham Construction and the design work by LDN Architects.

The scheme featured extensive hard landscaping and remodelling of the open central courtyard over an area of approximately 30,000 sq metres. The gently sloping site has been re-designed to provide an extensive public performance space. High quality granite paving, along with granite setts and traditional sandstone was used throughout with PAREX specialist mortars used for bedding, bonding and jointing to the various entrances on all 4 sides of the courtyard.
